HISTORICAL EVIDENCE
NOT VERIFIED ORGANIC RANKINGS

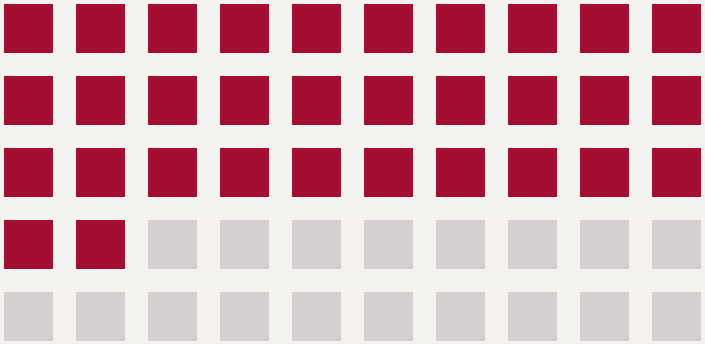
CURRENT RECORDED SEARCH VIEW

The evidence at a glance

50 provider profiles retained. The displayed ranking and the coverage threshold answer different questions.

50

provider profiles



Each square is one provider

32 ranked with numeric scores

18

non-numeric profiles

13 coverage-eligible profiles have no recorded top-10 contribution and no established rank. Three sparse ranks are withheld; two profiles have no supported denominator.

45

Coverage qualified

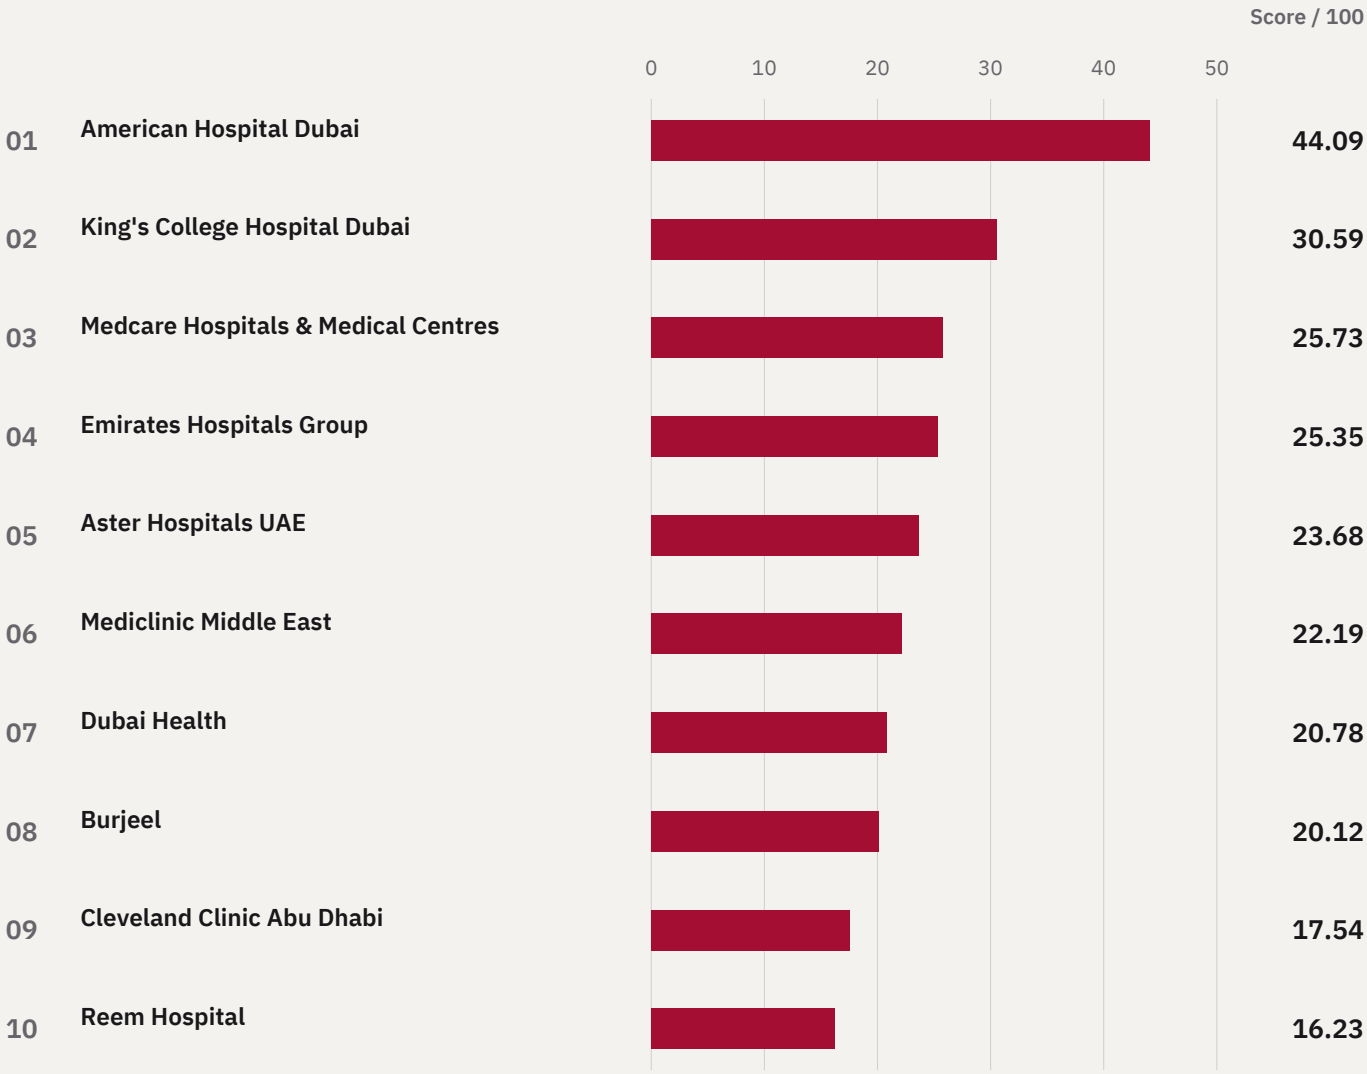
At least 10 supported queries. This is a separate coverage measure, not the number of displayed ranks.

Source: approved 29 October 2026 publication dataset. Missing evidence is not zero and coverage does not measure clinical quality. See the methodology and evidence appendix.

TOP 10 / CURRENT RECORDED SEARCH VIEW

The leading recorded scores

Scores are drawn from admitted contributions over each provider's fixed historical supported-query denominator. They are not a live market or clinical-quality ranking.



The chart uses a common 0-50 axis for legibility; the score itself is out of 100. Exact unrounded scores determine rank. Full current tables and all 50 profiles follow.

Source: approved 29 October 2026 publication dataset. No speed, trust or local points enter this search-only view. Historical composites remain separate.

READER ROUTE

Start with the view. Then inspect the evidence.

01 Recorded search score

The eligible providers, their scores and supported-query counts.

02 How the view works

Eligibility, exact ties, missing records and unverified positions.

03 All 50 provider profiles

Current status, recorded search and retained component evidence.

04 Historical composite appendix

The earlier 48-provider model, kept separate from current ranks.

05 Source periods and evidence map

Original dates, example records and source links.

Healthcare-provider websites are the research scope. This is not a comparison of clinical quality, patient outcomes or medical-device companies.

THE SHORT READ

Search visibility. Measured separately.

This edition compares recorded search scores separately from the earlier four-component total. Website speed does not affect this ranking.

50
provider profiles

45
meet minimum coverage

10
minimum queries

01 Read the score with its coverage

American Hospital Dubai leads at 44.09 / 100 across 93 supported queries. Exact recorded contributions set the order, not rounded displays.

02 Profiles retained; ranks withheld for limited evidence

13 eligible zero-contribution profiles have no established rank. JTS, KIMS and Kanad remain below the coverage minimum; Elaj and Private Care have no supported denominator.

03 31 unsupported positive contributions removed

The 894-row source ledger yields 446 positive selected provider/query contributions. Removing 31 unsupported positives changes 17 scores and six lower numeric ranks; the top-ten order is unchanged.

Edition: 29 October 2026. Original collection dates are unchanged. Historical composite results are retained only in the labelled appendix.

45 ELIGIBLE PROVIDERS / 1 OF 3

Recorded search score Historical query set

Scores / 100 from admitted contributions over fixed historical supported queries. Coverage is not verified absence. Zero-contribution profiles have no established rank.

Correction scope / Provider coverage

Rank	Provider / exact domain	Score	Coverage	Unresolved
1	**American Hospital Dubai** ahdubai.com	44.09	93	44
2	**King's College Hospital Dubai** kingscollegehospitaldubai.com	30.59	85	52
3	**Medcare Hospitals & Medical Centres** medcare.ae	25.73	96	41
4	**Emirates Hospitals Group** emirateshospitals.ae	25.35	86	51
5	**Aster Hospitals UAE** asterhospitals.ae	23.68	95	42
6	**Mediclinic Middle East** mediclinic.ae	22.19	96	41

-	**Universal Hospital** universalhospitals.com	No recorded top-10 contribution	72	65

Equal exact scores share a rank; subsequent ranks skip tied places. Two equal rounded displays can have different ranks. No movement comparison with historical composite ranks.

ONE RULE, ONE MEASURE

What this ranking actually measures

Eligible means at least 10 supported queries

Each eligible provider has at least 10 source-supported relevant queries. That caps a single query's possible effect at 10 points out of 100. It does not prove equal representation of every provider's services.

Recorded search only

Recorded search score sums admitted top-10 contributions over the fixed historical supported-query denominator. Unobserved results are unknown, not verified absence. Speed, trust and local inputs are excluded.

Ties use exact scores

Positive scores use exact competition order, displayed to two decimals. The 13 coverage-eligible profiles with no recorded top-10 contribution have no established public rank; raw zero is retained internally.

Sparse evidence stays visible, without a rank

JTS, KIMS and Kanad have 1, 1 and 6 supported queries. Their raw search and component values are retained; zero search displays and current ranks are withheld. Elaj Medical Centre and Private Care have no supported denominator, so their search scores and ranks remain uncalculated.

Historical composite ranks refer only to the earlier 48-provider view. They are not current search ranks or evidence of a provider's rise or fall.

REPRODUCE THE SCORE

One supported query. One equal share.

The search score uses the fixed selected run from the 137-query worksheet, admitted row corrections and each provider's unchanged supported-query denominator.

Query points = max(0, 110 - 10 x admitted position)

Search score = sum of query points / supported queries

Admitted position 1 earns 100; position 10 earns 10

Points fall by 10 per admitted position. No admitted contribution supplies no positive points. This computational zero does not establish absence; the historical query denominator stays fixed.

Choose the run, then the best admitted position

Keep the first run in worksheet order. Apply admitted corrections to its selected rows, then take the provider's best corrected position for each query. Only admitted selected-row ordinals contribute positive points. Unverified rows remain raw evidence, not current positive contributions; later runs do not replace the selected run.

The denominator is provider-specific

Only queries whose relevance is supported enter the denominator. Unresolved relevance stays outside it. The minimum-10 rule decides eligibility, not a replacement denominator of 10.

Round for display, not for rank

Exact rational scores set competition ranks. Displays use two decimals with half-up rounding. No speed, trust or local points are added.

31 unsupported positive contributions are excluded. The fixed denominator does not certify absence or query representativeness.

EVIDENCE BOUNDARIES

Do not turn missing evidence into certainty.

1,997 observations with no recorded appearance

Across the baseline, 1,997 supported-query observations have no recorded appearance and contribute zero recorded top-10 evidence. That is not confirmed absence from Google. Queries whose applicability is unknown stay outside the denominator, rather than being declared irrelevant.

Original positions still need verification

974 selected-best provider/query pairs still lack verified absolute organic positions across 108 queries. Of these, 31 retain worksheet positions 1-10, and 149 have ranks 11-15. Their positions remain only as raw historical records; the 31 positive unverified contributions are excluded from current scores. Within that unresolved set, 408 have page-local content matches: 407 supported by result order within the captured page and 1 by content only. These matches do not verify absolute organic positions.

894 admitted source rows

The ledger contains 186 original-source and 708 alternate-source rows. Within the supported selected run, 447 admitted rows reduce to 446 positive provider/query contributions. Alternate evidence does not establish the original capture UUID or session identity.

What the score does not tell you

The report does not measure current patient demand, visits, enquiries, bookings or clinical quality. Reconstructed English and Arabic panels use separate query sets and remain descriptive evidence, not inputs to this ranking.

Correction scope / Provider coverage

The source-record mapping is preserved. Linked private records still require the appropriate access; this PDF does not change those permissions.

ALL 50 PROVIDERS RETAINED

Look beyond the headline score.

Profiles are alphabetical by exact domain. The headline is the recorded search score. Positive coverage-eligible contributions have an order; zero-contribution and unsupported profiles explain why no rank is shown.

44.09	93	44
Recorded search score / 100	Supported queries	Unresolved queries

Components are retained, not recombined

Search includes the admitted row corrections. Speed, trust signals and the local snapshot retain their earlier values. They do not create a current composite rank.

Separate language-panel counts

English and Arabic query appearances describe the reconstructed panels of 54 and 47 queries. They do not enter this ranking or establish demand, visits or conversions.

Same domain, same source dates

A profile covers the named domain, not every branch or related website. Historical dates remain unknown when the source does not record them. Current service-scope checks are not backdated.

Correction scope / Provider coverage

The full earlier composite table is retained in the historical appendix, not beside current profile ranks.

METHOD & INTERPRETATION

Historical component calculations

Historical reference only. The following rules reproduce retained component scores and the earlier composite; speed, trust and local evidence do not enter the current search-only ranking.

Laboratory speed: 20%

The speed calculation combines 60% of the mobile Lighthouse performance score with 30% of the desktop score, then subtracts a penalty for mobile Largest Contentful Paint. The penalty is zero at up to 2.5 seconds, ten points above 2.5 through four seconds, and 25 points above four seconds. Negative raw results are set to zero; the result is divided by 90 and scaled to 100.

These are laboratory measurements, not a distribution of real-user performance. The original raw values are preserved.

Website trust signals: 15%

The eight equally weighted signals are author bylines, a medical reviewer, a last-reviewed date, citations or references, an editorial-policy URL, a privacy URL, Organization schema and MedicalWebPage schema. The score is the percentage recorded as Yes; all eight fields require Yes or No. The checklist records website features; it does not assess the medical reliability of their content.

One local-search snapshot: 5%

The local component uses one complete pack of three listings recorded on 15 April 2026 for "Best private Hospital", with visible UAE attribution. International Modern Hospital, American Hospital Dubai Science Park and Medeor Dubai appear; the other ranked providers do not appear in this retained pack.

This single observation does not measure current or nationwide local visibility. Removing its 5% weight without reallocating it swaps the first two places. That sensitivity check described the earlier composite, not the current recorded-search ranking. The exact search origin, capture timestamp and activation of the visible filter control remain unverified. A conflicting February snapshot is not combined with it.

Which component record is used

Complete original speed and trust records are used first. Burjeel and SEHA speed supplements were collected within 19-21 October 2026; separate measurement dates are not recorded. Dubai Health speed and the trust audits for Aster, Burjeel, Dubai Health and SEHA are dated 19 October 2026. Missing original measurement dates remain unknown. The results combine different periods rather than a single October survey.

Al Sharq has two historical speed records. The calculation uses the first in source order; it is not known to be newer or more accurate. In the earlier composite, the alternative adds 0.6 points and changes its historical rank by three places. Both row references remain in the source record.

Totals and ranks

The composite uses the stated weights without redistributing a missing component’s weight. A missing required input or an empty supported-query denominator yields no total. Exact values determine competition ranks; equal exact totals share a rank. Display rounding does not change that order, and no score bands are applied.

Differences in query coverage, unresolved relevance, recorded-position conventions and source dates limit direct comparison.

SOURCE PERIODS

When the evidence was recorded

This edition is dated 29 October 2026. The original research edition was dated 20 October; neither is a single measurement date for all evidence.

April-May 2026

Reconstructed search sequences

Archive record dates, not certified capture timestamps. City, device and session conditions remain unverified.

15 April 2026

The local pack

One "Best private Hospital" pack with visible UAE attribution. Exact origin, time and visible-filter activation remain unverified.

Dates absent

Original speed and trust records

Complete original records retained first. Historical dates remain unknown where the source does not record them.

19-21 October 2026

Targeted supplements

Burjeel and SEHA speed: collected within 19-21 October; separate measurement dates not recorded. Dubai Health speed: 19 October. Aster, Burjeel, Dubai Health and SEHA trust: 19 October.

19-20 October 2026

Applicability review

Current advertised scope retrieved 19 October. The JTS urgent-care assessment uses cached official text retrieved on 20 October. Neither is backdated.

Worksheet order does not establish capture chronology. A collection window does not establish the date of an individual speed measurement.

REPRODUCIBILITY & ACCESS

Evidence record and access

The dataset preserves exact calculations and source references. The following pages link to selected records; access to private evidence is unchanged.

Historical composite source	The dataset records the selected 137-query worksheet, original row identifiers, exact component fractions, applicability decisions, calculation inputs and source references. Historical ranks use exact values; the corrected publication dataset supplies the separate search view.
Reconstructed English panel	54 sequences and 540 result observations. These support descriptive English reach and selected provider examples, not the composite denominator.
Reconstructed Arabic panel	47 sequences and 470 observations. Eight retained sequences were added to the earlier 39-sequence subset. The earlier 39-query cluster analysis does not cover all 47 queries.
Source access	Full replication requires the worksheet records, applicability decisions, component inputs and calculation rules, not just this PDF or its hash. Some evidence is private. Request a specific record from Maps of Arabia; access and redistribution remain subject to existing permissions.

ORIGINAL BASELINE DATASET SHA-256

e246c4f94645125a17d7493551a8ade8186fa414d5ed98223995ec0f30ac3cba

The hash identifies a retained file. It cannot certify capture conditions that the source itself does not establish.

FROZEN CORRECTION LEDGER

What changed in the selected records

The 894-row ledger supplies 447 selected supported rows, reduced to 446 positive provider/query contributions. Another 447 ledger rows are not selected supported scoring inputs. The 31 unsupported historical positive contributions are excluded.

186 original-source observations

The original same-source evidence remains separately identified from the alternate-source ledger.

708 alternate-source observations

These are admitted ordinal observations with content correspondence. They do not authenticate the original capture UUID, session or exact capture time. Page-one evidence does not validate lower-page rows.

The selected run stays fixed

CAN137-089 second-run evidence remains outside the fixed selected-run output. The alternative best-across-runs sensitivity is not applied. Missing English 004, 015 and 129 evidence remains unresolved.

DEDUPLICATED ROW OVERLAY SHA-256

29 OCTOBER 2026

What changed in this edition

Healthcare naming

The report now uses Healthcare consistently for its provider-website scope.

A minimum of 10 supported queries

45 providers meet coverage; 32 have positive recorded contributions. Another 13 have no established rank; three sparse and two no-denominator profiles are retained.

Search only, historical composites separate

Current rank uses the partially source-checked selected-run search score. Earlier composite ranks and values stay unchanged in the historical appendix.

Same source evidence and dates

Removing 31 unverified positive contributions changes 17 scores and six numeric ranks; the top-ten order is unchanged. Source dates, components, denominators and all 50 profiles are retained. This is not verified absence.

PUBLICATION DATASET SHA-256

d2bba986d8cd8971984e3923bdb44e208a3e17012337b0b115b5922b5c963da3

Correction scope / Provider coverage

This edition contains the corrected search view. Evidence limits and original collection dates are recorded in the methodology and source appendix.
